PROFESSIONAL SUMMARY

Innovative Full-Stack Developer specializing in Go, Python, and scalable distributed systems. Proven expertise in architecting enterprise AI platforms, machine learning pipelines, and decentralized identity (DID) solutions. Adept at building privacy-first backend architectures that power seamless user experiences.

EDUCATION

Bachelor Of Technology (Artificial Intelligence & Data Science)

Karmaveer Adv. Baburao Ganpatrao Thakare College of Engineering

2028

Nashik, Maharashtra

PROJECTS

Enterprise RAG Pipeline & Conversational AI | Go, SvelteKit, PostgreSQL (pgvector), Redis, MinIO, Docker, Kubernetes, Ollama

Jun 2026

- Architected and deployed a privacy-first, full-stack AI platform capable of processing large documents into a searchable vector database for intelligent, context-aware chatbot interactions.
- Built a high-performance Go (Golang) microservice architecture utilizing Redis (Asynq) for asynchronous background job processing and MinIO (S3) for scalable object storage.
- Integrated local LLMs (Ollama) and PostgreSQL (pgvector) to perform token-aware chunking and semantic vector similarity search, eliminating reliance on external APIs and ensuring 100% data privacy.
- Developed a responsive SvelteKit web interface featuring Server-Sent Events (SSE) to stream live document ingestion status and real-time AI chat responses directly to the user.
- Engineered a hybrid-cloud deployment strategy by orchestrating 6 Docker containers locally via Kubernetes (Minikube) and securely tunneling the API to a globally distributed Vercel frontend.

QuantShell | React (Vite), Python, FastAPI, Docker, Pandas, XGBoost, REST, WebSockets

Jul 2026

- Architected and deployed a full-stack web application simulating a high-frequency trading pipeline, utilizing React (Vite) for a custom Terminal User Interface (TUI) and Python (FastAPI/Docker) for the backend.
- Engineered an end-to-end Machine Learning pipeline using Pandas and XGBoost to ingest real-time market data, calculate order book micro-structure features, and predict short-term price movements.
- Built a resilient REST and WebSocket API architecture that streams live financial data and model inferences, implementing graceful stochastic fallbacks to guarantee 100% uptime against external API rate-limits.
- Designed interactive React dashboards featuring dynamic state management, persistent local storage, and ASCII-style data visualizations to display chronological backtest metrics and cumulative PnL trajectories.

Nexus | Account Abstraction, SIWE (EIP-4361), Smart Contract Concepts, Web3 Auth

Aug 2026 - Sep 2026

- Designed an enterprise security enclave issuing and managing W3C-compliant Decentralized Identifiers (DIDs) for personnel, securely binding web2 credentials to cryptographic wallets.
- Implemented Sign-In with Ethereum (SIWE / EIP-4361) for authentication via hardware/web3 wallets using cryptographic message signing, bypassing vulnerable password systems.
- Built a strict Role-Based Access Control (RBAC) architecture governing system permissions, ensuring critical actions (e.g., issuing Soulbound tokens, revoking identities) are heavily restricted and immutably logged.
- Engineered an automated wallet derivation system using Magic Link, instantly provisioning deterministic custodial wallets and assigning verifiable DIDs to users without requiring prior blockchain knowledge.
- Developed a unified telemetry and webhook logging system that intercepts critical security actions, recording them into a transparent, timestamped ledger for continuous compliance auditing.

TECHNICAL SKILLS

Languages | Go, Python, JavaScript, TypeScript, Solidity, SQL

Frameworks | React, SvelteKit, FastAPI

Developer Tools | Docker, Kubernetes, Vercel, Redis, MinIO, Git, Linux

Libraries | Pandas, XGBoost, Ollama, pgvector, Web3 Auth (SIWE)
